Photography

John Andrews says "the subject should be thought over and visited at all lights, and a sketch of it is of great use in deciding what to take in and leave out." In pg 5 he is implying that to perfect the craft of photography you must first study the way stuff looks in different lighting and you should draw out a sketch to see how far you should take the picture from. He believes the true purpose of art is that it never stops evolving that the old silver print is passing and new stuff are coming so art is never stopping. Andrews mentions multiple times to not take to many pictures instead take quality pictures at different angles, lighting, distances and different times of day, to wait and watch means to be patient and observe what you are truly looking at and appreciate it, when a photographer is taking so many photos, he doesn't seem to understand what it truly means to appreciate art and be an artist so they should take their time and view the world through their own eyes. Andrews says "it is useful to an artist by enabling him to complete his picture by means of added detail ; but no amount of detail or facsimile, either in a landscape or portrait, will make a picture" in pg 12. He says that photographs have the details of a landscape but it wont make the picture I think he is implying that the photographer can take a picture and get all the details but if he didn't study how it would look compared to other ways he could take it then it wont be a good picture instead one must try to perfect what they are looking for in multiple different ways.

Artistic feeling can be improved by learning and studying nature and some of the best masters of landscape art, compare the lighting and shading with nature by studying other artist these transforms taking pictures to an authentic artistic process by showing the photographer understands what they are doing and what they should be looking for and not just take a random picture. Emerson says " Nature passed through the alembic of man." meaning a man filters how

they want nature to perceived based on how they take a picture and its raw experience of the physical world, but Andrews later says " natural facts can be of use to a painter dependimg very much on the individual genius of the artist." So man can filter how they want a picture to be taken but it is limited based on how much a person knows about art. Hamerton believes photography can never evolve to a fine art, because you can't change nature and its lighting he believes it takes no imagination to take a picture and that's what's necessary to turn something into fine art. Because you cant change nature meaning you cant be creative around it, one just sees something they like the look of and take a picture Hamerton believes an artists shouldn't present natural truth as it is. Both Hamerton and Emerson have similar beliefs but Emerson says by taking a picture and studying what he knows about art that the photographer is applying filters based on natural lighting. On the other hand, Hamerton thinks it's not very genius of a artist to take a picture without being able to change nature.

I believe Artificially generated images are not closely related to pictures let alone drawings or painting, when we did the posters for a movie I had something specific in mind that I would have liked to drawn but AI just takes what I gave it and generated an image based on how I worded it. Based on Andrews beliefs that art never stops evolving I think he might be ok that AI generated images are considered art but maybe not closely related maybe far cousins that have never met before. Emersons idea that nature passed through the alembic of man, would be like filtering what you really want the image to look like and really get into detail explaining the image in a prompt maybe he believes there closest related out of the three. I think Hamerton would believe AI has no place with art because he was really sceptical about pictures, but his whole point was to have an artistic thought process, so if you came up with a really detailed prompt and prove that's what you were going for he might let it be considered art. I think it was fair for Jason to

enter the competition if there wasn't something specifically saying he couldn't use AI generated images and the competition has to do a better job to prevent this from happening if they want this to stop but, I think it wasn't fair for him to actually win the art competition because we don't know if that's what he actually wanted as a final result or just got lucky that AI did a good job, he said he spent 80 hours and who knows how many images he generated compared to how many drawings someone can come up with in that same time period. Finally, I believe using AI doesn't represent having an authentic artistic practice, maybe a creative practice but not artistic.
